Basics of EE

- EE is a useful measure of the degrees of freedom in quantum many body systems.
 - ① Using EE to detect the central charge (the coefficient of logarithmic divergent term in Odd dimension)[C. Holzhey, F. Larsen and F. Wilczek, 94][P. Calabrese and J. L. Cardy, 04][S. Ryu and T. Takayanagi,06][...].
 - ② Detecting the topological degrees of freedom of topological field theories (finite piece of EE)[A. Kitaev and J. Preskill,05][M. Levin and X.G.Wen,05].
 - ③ Measuring the degrees of freedom of local operators (Quantum dimension).[M. Nozaki, T. Numasawa and T. Takayanagi,14][S. He, T. Numasawa, T. Takayanagi and K. Watanabe,14][P. Capta, M. Nozaki and T. Takayanagi, 14][M. Nozaki,14][Wu-Zhong Guo, S. He,15].

Basics of EE

- General diagnostic: divide quantum system into two parts (A and B) and use entropy as measure of correlations between subsystems

- Integrate out degrees of freedom in outside region (B). Remaining dof are described by a density matrix ρ_A .

$$S_A = -\text{Tr}_A \rho_A \log \rho_A \quad (1)$$

comments

Main motivation

- EE has following UV structure in various field theory:

In even dimensions

$$S_A = C_{d-2} \frac{L^{d-2}}{\epsilon^{d-2}} + C_{d-4} \frac{L^{d-4}}{\epsilon^{d-4}} + \dots + C_2 \frac{L^2}{\epsilon^2} + C_0 \log \frac{L}{\epsilon} \quad (2)$$

In odd dimensions

$$S_A = C_{d-2} \frac{L^{d-2}}{\epsilon^{d-2}} + C_{d-4} \frac{L^{d-4}}{\epsilon^{d-4}} + \dots + C_1 \frac{L}{\epsilon} + (-1)^{\frac{d-1}{2}} F \quad (3)$$

These cases show the EE have area law in leading divergent term.

Summary and
comments

- One question: How to calculate EE in quantum system?
- A basic method of calculating EE in QFTs is so called the replica method.

$$S_A = - \left. \frac{\partial \log \text{Tr}(\rho_A)^n}{\partial n} \right|_{n=1} = \lim_{n \rightarrow 1} S_A^n$$

- The relation provides a practical way to compute EE in field theory, although it is difficult.
- In this talk, we would like to apply replica trick in string theory.

Replica vs Orbifold construction

- The density matrix is

- Do the n copies of density matrix

- In 2D real space, do analytical continuation $n = 1/N$ to obtain the orbifolds C/\mathbb{Z}_N

For vacuum state,

Entanglement entropy

$$S_A = -(\partial_n - 1) \log Z_n \Big|_{n=1}$$

All we need to know is the partition function Z_n on the n -fold cover \mathcal{M}_n !

In this talk, we would like to apply replica trick in string theory.

Summary for Final
Results

Summary and
comments

- A free field theory on $M = R^D$, whose coordinate denoted by $(x_0, x_1, \dots, x_{D-1})$. The subsystem A is $x_1 > 0$.
- Combining (x_0, x_1) into a complex plane C and the n -th Rényi entanglement entropy $S_A^{(n)}$,

$$S_A^{(n)} = \frac{1}{1-n} \left[Z^f(C/\mathbb{Z}_N \times R^{D-2}) - \frac{1}{N} Z^f(C \times R^{D-2}) \right] \Big|_{N=\frac{1}{n}}. \quad (5)$$

The \mathbb{Z}_N orbifold action g is given by

$$g : (X, \bar{X}) \rightarrow (e^{\frac{2\pi i}{N}} X, e^{\frac{-2\pi i}{N}} \bar{X}). \quad (6)$$

EE for Free Scalar

- Firstly, we take free massive scalar field theory as an example.
- The partition function of a spinless particle on the flat space

$$Z^f(R^D) = \int_{\epsilon^2}^{\infty} \frac{ds}{2s} \text{Tr} e^{-s(\hat{k}^2+m^2)} \quad (7)$$

$$\begin{aligned} &= \frac{V_D}{(2\pi)^D} \int_{\epsilon^2}^{\infty} \frac{ds}{2s} \int d^D k e^{-s(k^2+m^2)} \\ &= V_D \int_{\epsilon^2}^{\infty} \frac{ds}{2s} (4\pi s)^{-\frac{D}{2}} e^{-sm^2}, \end{aligned} \quad (8)$$

the parameter s is the Schwinger parameter which is a moduli in the first quantization approach.

Results

Summary and
comments

EE for Free Scalar

- The partition function of a spinless particle on \mathbb{Z}_N orbifold is

$$\begin{aligned} Z^f(C/\mathbb{Z}_N \times R^{D-2}) &= \int_{\epsilon^2}^{\infty} \frac{ds}{2s} \text{Tr} \frac{1}{N} \sum_{j=0}^{N-1} g^j e^{-s(\hat{k}^2+m^2)} \\ &= \int_{\epsilon^2}^{\infty} \frac{ds}{2s} \int d^D k \frac{1}{N} \sum_{j=0}^{N-1} \langle \vec{k} | g^j | \vec{k} \rangle e^{-s(k^2+m^2)} \end{aligned}$$

Here g is the generator of \mathbb{Z}_N . Due to twist boundary condition (BC), one should project out some modes related to the BC.

- Finally, we can get the REE from (5);

$$S_A^{(n)} = \frac{(n+1)\pi V_{D-2}}{6n} \int_{\epsilon^2}^{\infty} \frac{ds}{(4\pi s)^{\frac{D}{2}}} e^{-m^2 s}. \quad (10)$$

Especially the coefficient V_{D-2} shows the **area law of REE**.

Summary and
comments

- Generalize to all Higher spin Fields and Fermion fields with considering proper spin structure.
- Complicated details ...
- The generic expression of heat kernel expression for spin field [D. V. Fursaev and G. Miele, 96]

$$\log Z^{(j)} = (-1)^F \int_{\epsilon^2}^{\infty} e^{-m^2 s} \cdot (4\pi s)^{-D/2} \left(A_0^{(j)} + s A_1^{(j)} + \dots \right) \int_{R^{D-2}}, \quad (11)$$

where $\int_{R^{D-2}}$ denotes the volume of R^{D-2} .

- $$A_1^{(j)} = Q^{(j)} + 4\pi c_1^{(j)} (N - 1) + O((N - 1)^2), \quad (12)$$

where the constant $Q^{(j)}$ denotes a singular contribution, which is non-zero only for $j \geq 3/2$.

Summary for Final
Results

Summary and
comments

- Three difficulties for $EE = BH$ Entropy
 - ① EE in field theory is divergent V.S. BH entropy is finite due to Hawking formula.
 - ② The EE has no classical contribution and starts at one loop V.S. the BH entropy is inversely proportional to the coupling constant.
 - ③ The EE depends on couplings of various particles in the theory V.S. BH entropy does not.
- Let us move to String theory. Probably...

Summary and
comments

- For Bosonic string, there is no well defined EE due to IR divergent (Tachyon presence).
- For Open Superstring, the ToT conical entropy can be a summation of conical entropy for all higher spin fields(**area law divergences**).
- The divergence shows that the backreaction of open string sectors to closed string sectors is very important.
- To treat this backreaction properly motivates us to study the conical entropy in closed string.

- Then combining (x_0, x_1) into a complex plane C , we can introduce the n -th REE $S_A^{(n)}$ of string theory,

$$S_A^{(n)} = \frac{1}{1-n} \left[Z_{closed}(C/\mathbb{Z}_N \times R^8) - \frac{1}{N} Z_{closed}(C \times R^8) \right] \Big|_{N=\frac{1}{n}}, \quad (15)$$

where C/\mathbb{Z}_N is the standard \mathbb{Z}_N orbifold in type II string.
The \mathbb{Z}_N orbifold action g is given by

$$g : (X, \bar{X}) \rightarrow (e^{\frac{2\pi i k}{N}} X, e^{-\frac{2\pi i k}{N}} \bar{X}), \quad (16)$$

where k is a positive integer fixed below.

Conical Entropy in string theory

- The partition function of type II string on $C/\mathbb{Z}_N \times R^8$ is...

The image shows a handwritten equation on lined paper. On the left side, there is a double sum over indices m and n . Each term in the sum is a diagram consisting of a horizontal line with a shaded, trapezoidal region above it. The two diagrams are connected by a plus sign. This is followed by an equals sign. On the right side, there is a single sum over index m , with a single diagram of the same shaded trapezoidal region above a horizontal line.

Double sum is hard to treat. The alternative way?

- More precisely, $C/\mathbb{Z}_N \times R^8$ is

$$Z_{\text{closed}}(C/\mathbb{Z}_N \times R^8) = V_8 \int_F \frac{d\tau^2}{4\tau_2} \cdot (4\pi^2 \alpha' \tau_2)^{-4} \cdot \sum_{l,m=0}^{N-1} \frac{|\theta_1(\nu_{lm}/2|\tau)|^8}{N |\eta(\tau)|^{18} |\theta_1(\nu_{lm}|\tau)|^2} \quad (17)$$

where $\nu_{lm} = \frac{k(l-m\tau)}{N}$.

- In string theory on Melvin background, the folding trick can simplify this issue with T duality.

- Do slightly deformation or modification (**Introducing Melvin background**). The follow approach can lead us to preliminary results and heuristic understanding on EE.
- The target spaces of models have the structure of Kaluza-Klein (KK) theory with the topology $M_3 \times R^{1,6}$. M_3 is given by S^1 fibration over R^2 .

What is Melvin background

- We just used following figure to show the structure

Here non-trivial two Kaluza-Klein (K.K.) gauge fields A_φ and B_ϕ originate from K.K. reduction of metric $G_{\varphi y}$ and B-field $B_{\varphi y}$, respectively.

Summary and
comments

- Folding trick enables us to rewrite it as the integral over the strip S defined by $-1/2 < \tau_1 < 1/2$ and $\tau_2 > 0$, with a single sum:

$$Z_{closed} [(C \times S^1)/\mathbb{Z}_N \times R^7] = Z_0 \int_S \frac{d\tau^2}{\tau_2^5} \sum_{w=-\infty}^{\infty} e^{-\frac{\pi R^2}{\alpha^2 \tau_2} w^2} \cdot \frac{|\theta_1(w/N|\tau)|^8}{|\eta(\tau)|^{18} \cdot |\theta_1(2w/N|\tau)|^2}, \quad (24)$$

where the integral region S denotes the strip defined by $-1/2 < \tau_1 < 1/2$ and $\tau_2 > 0$.

- $\omega = N\alpha + \beta$ and the α runs all integers from $-\infty$ to ∞ , while β takes $0, 1, 2, \dots, N - 1$.

(Twisted) Conical Entropy

- After we did the Poisson resummation:

$$\sum_{\gamma \in \mathbb{Z}} \exp(-\pi a \gamma^2 + 2\pi i b \gamma) = \frac{1}{\sqrt{a}} \sum_{\alpha' \in \mathbb{Z}} \exp\left(-\frac{\pi(\alpha' - b)^2}{a}\right), \quad (25)$$

- we find

$$Z_{closed} [(C \times S^1)/\mathbb{Z}_N \times R^7] \quad (26)$$

$$\begin{aligned} &= Z_0 \int_S \frac{d\tau^2}{\tau_2^5} \frac{\sqrt{\alpha' \tau_2}}{NR} \sum_{\gamma \in \mathbb{Z}} \sum_{\beta=0}^{N-1} e^{-\frac{\pi \alpha' \tau_2}{R^2 N^2} \gamma^2} \\ &\quad \cdot e^{2\pi i \frac{\beta \gamma}{N}} \frac{|\theta_1(\beta/N|\tau)|^8}{|\eta(\tau)|^{18} \cdot |\theta_1(2\beta/N|\tau)|^2}. \end{aligned} \quad (27)$$

In the following, we will study this function in IR $\tau \rightarrow 0$ and UV region $\tau \rightarrow \infty$.

Summary for Final
Results

Summary and
comments

- The moduli integral of the twisted conical entropy \tilde{S}_A does converge both in the IR ($\tau \rightarrow 0$) and UV ($\tau \rightarrow \infty$) region.
- In bosonic string Melvin backgrounds, the twisted conical entropy will get divergent due to the tachyon.

Summary and
comments

- In the large T-dual radius limit $R_{orb} \rightarrow \infty$, the twisted conical entropy behaves as follows:

$$\tilde{S}_A(R_{orb}) \simeq \tilde{s} \cdot \frac{V_7}{\alpha'^{7/2}}. \quad (28)$$

Which is finite. But there is **no area law here** (One loop quantum correction to BH is **0**).

- In superstring, this UV divergence can be removed owing to the string scale cutoff ($\sqrt{\alpha'} = l_s$).

Conical Entropy vs EE

- By definition, Conical Entropy = $EE(>0)$ + Surface term contribution.
- Due to SUSY, there is nature cancelation for Conical Entropy.[L. Susskind, J. Uglum, 94]
- In terms of BH entropy for the Rindler horizon, Conical entropy from string theory **one-loop amplitudes** corresponds to the leading quantum correction.[L. Susskind, J. Uglum, 94]
- In twist EE, there is **no area law term** and it means no one loop quantum correction to BH entropy.

Summary and
comments

Summary and comments

- 1 Reproducing Conical entropy for spin 0,1/2,1,3/2 and 2 and offer for any higher spins fields. (Nice Check and apply this logic to String theory.)
- 2 The conical entropy for open string turns out to be divergent even in superstring. The back reactions of open strings to the closed string sector. (Future work).
- 3 The twisted conical entropy \tilde{S}_A is confirmed to be finite.
- 4 The twisted conical entropy \tilde{S}_A does not have any contributions related to the boundary ∂A . Indirect signal to support the quantum corrections to conical entropy S_A in type II closed superstring is vanishing. (Future Problem).
- 5 Higher genus string amplitude. (Future Problem)
